

Google Cloud Vibe Cafe

Introducing Google Cloud Vibe Café

Sip, Prompt, Create

We are taking the power of our AI outside the office and into a familiar coffee shop environment, to show how easy and useful our AI is.

A pop-up Vibe Café where AI doesn't just make coffee art, it writes code. Customers order coffee and vibe code a functional app while they wait.

From brew to breakthrough

Stepping into the Vibe Café, guests aren't just getting a coffee hit; they're getting the chance to discover the potential for their ideas to become reality and how they can make it happen with Google AI Studio, Gemini and Google Cloud.

No need to understand complex coding syntax. Just simple ways to showcase Google and AI and use natural language to prompt an AI-powered app into existence in the time it takes to steam a latte.

The Vibe Café is a fun, low-friction invitation to start building - demonstrating that with Google Cloud, the daily grind of development and creativity is as smooth, rewarding and accessible as your favourite cup of coffee.

Proposed App: Cloud in your Coffee

Customise your coffee foam.

How it works:

- As part of the drinks order process, Brand Ambassadors will use an app to capture the user's name, coffee order and then ask the user about their "happy place" or "favourite travel destination". The user will not actually enter anything themselves.
- This becomes a prompt that gets re-written/optimised to create a Nano Banana image that will get either saved / sent somewhere like a Drive folder for our agency to access (exact details TBC). GenAI image and user name will need to be stored together so we can pull up repeatedly if needed (for reprinting etc)
- A Brand Ambassador-operated machine prints the generated image with the user name onto the coffee foam to the user.

The output: Customers are provided with this cute, simple and shareable addition to their coffee.
